

# Muon Alignment Constants Proposed for Sign-off (for CRAFT and Cosmic Ray Monte Carlo)

Jim Pivarski

*Texas A&M University*

for the Muon Alignment Community

3 June, 2009

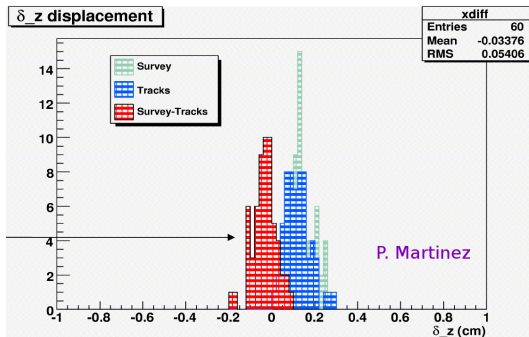

- ▶ DTAlignmentRcd for CRAFT
  - ▶ internal DT alignment from tracks, independently confirmed by survey
  - ▶ global DT positions and angles from tracks, tested with relative differences and high- $p_T$  momentum reconstruction
- ▶ CSCAlignmentRcd for CRAFT
  - ▶ individual chambers relative to disks from photogrammetry
  - ▶ disk-bending due to  $\vec{B}$  from laser measurements
  - ▶ whole-disk positions relative to tracker from tracks
- ▶ Updated STARTUP Scenario for Monte Carlo
  - ▶ includes the above improvements
  - ▶ only appropriate for pre-collisions MC

# Internal DT alignment

Jim Pivarski 3/13

- ▶ Physically-motivated corrections to internal chamber geometry (superlayers): layer of glue, about 1 mm thick in  $z$
- ▶ Track-based measurement ( $x$  residuals versus entrance angle) and survey agree in  $z$
- ▶ 540  $\mu\text{m}$  verification in station 1 (plot)
- ▶ Track-based  $x$  corrections also improve whole-chamber segment angles

- ▶ Align individual muon chambers relative to tracker with tracker-only refits of globalMuons (unbiased residuals)
- ▶ Fully 6-DOF procedure, fitting for all alignment corrections and major instrumental/propagation effects together, once per chamber
  - ▶ four residuals:  $x$ ,  $y$  position and  $\frac{dx}{dz}$ ,  $\frac{dy}{dz}$  entrance angle
  - ▶ correlation between position and angle residuals included
  - ▶ single-scattering (power-law) convoluted with Gaussian errors
- ▶  $100 < p_T < 200$  GeV, because low- $p_T$  tracks are biased by an effect *other than* magnetic field map or material budget errors
- ▶ Consistent with tracker geometry in Tracker\_Geometry\_v5\_offline
- ▶ Region aligned: wheels  $-1$ ,  $0$ ,  $+1$ , all sectors except 1 and 7
- ▶ Realistic cosmic ray Monte Carlo study (except tracker misalignment); achieved the following systematics-dominated accuracy:

$x$	$190 \mu\text{m}$	$\phi_x$	$0.42 \text{ mrad}$
$y$	$840 \mu\text{m}$	$\phi_y$	$0.09 \text{ mrad}$
$z$	$630 \mu\text{m}$	$\phi_z$	$0.29 \text{ mrad}$

- ▶ Up-to-date alignment code in CVS (and 3.1.0 release)

# Example in real data

Jim Pivarski 5/13

- Wheel 0, station 1, sector 10 (largest statistics, bottom of CMS)

Before (misaligned)

After (aligned)

DT wheel 0, station 1, sector 10

DT wheel 0, station 1, sector 10

- Differences between proposed constants and previous (CRAFT\_ALL\_V5-12) shown below
- Systematic rotation of wheels is due to low- $p_T$  tracks used in previous alignment

- ▶  $\frac{(1/p_T)_{\text{top}} - (1/p_T)_{\text{bot}}}{\sqrt{2}(1/p_T)_{\text{bot}}}$  (equal to  $\frac{(p_T)_{\text{top}} - (p_T)_{\text{bot}}}{\sqrt{2}(p_T)_{\text{bot}}}$  if Gaussian)
- ▶  $200 < p_T < 2000$  GeV tracks (not used in the alignment)
- ▶ Key: **tracker-only**, sometimes with station 1, **with station 1**, **all stations**

CRAFT\_ALL\_V5-12

new constants

Rel. res., 200 < pT [GeV] < 2000

- ▶ **Tracker-only:** 4.51%
- ▶ Tracker and sometimes station 1: 5.33 → 4.36%
- ▶ **Tracker and muon station 1:** 6.76 → 4.50%
- ▶ Tracker and all muon stations: 9.11 → 5.65%

J. Tucker

- ▶ 2008 MC  $\frac{(1/p_T)_{\text{meas}} - (1/p_T)_{\text{gen}}}{\sqrt{2}(1/p_T)_{\text{gen}}}$  tracker + station 1 resolution:

IDEAL: 2%, CSA08 10 pb<sup>-1</sup>: 3%, STARTUP: 6% at 200 GeV

- ▶ Cosmic splitting  $\frac{(1/p_T)_{\text{top}} - (1/p_T)_{\text{bot}}}{\sqrt{2}(1/p_T)_{\text{bot}}}$  (same reco): 4.5% at 200 GeV

## CSC alignment overview

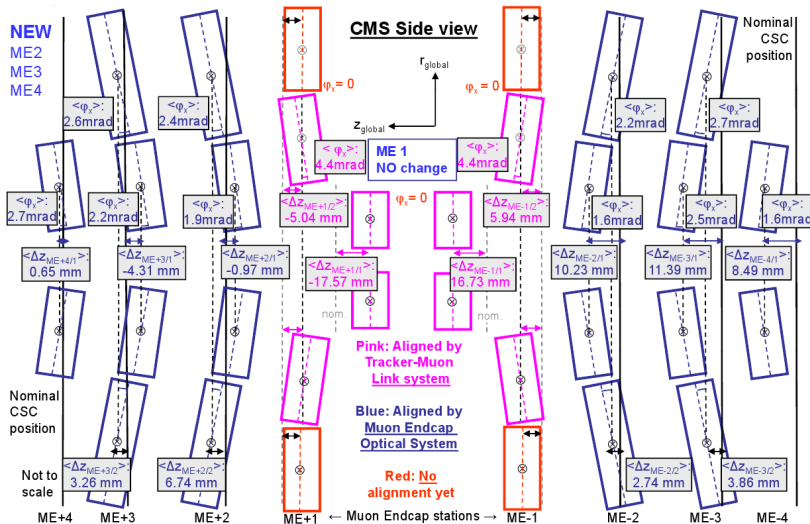

- ▶ Photogrammetry + disk-bending (lasers) + disk positions (tracks)

## CSC photogrammetry

- ▶ Describes individual chamber positions relative to their disks (300  $\mu\text{m}$  resolution)
- ▶ Not expected to move in  $x$  and  $y$  during 0 T  $\rightarrow$  3.8 T

► From Straight Line Monitor lasers and the Link System

- ▶ Local cathode strip residuals ( $\approx r\phi$ ) as a function of chamber
- ▶ Fit ME1/2 (2/2) to global  $x$ ,  $y$ ,  $\phi_z$ , cross-check with ME1/3 (3/2)

- ▶ Biggest correction:  
ME-2 and ME-3  
 $\phi_z$ : 1.44 mrad  
 $x$ : 4.4 mm  
 $y$ : -0.1 mm
- ▶ ME-2/2 fit (top) is a good match to ME-3/2 (bottom)

# Cross-checks for CSCs

Jim Pivarski 11/13

- ▶ Raw globalMuon residuals (what we used for alignment): improved by construction
- ▶  $p_{\text{tracker}} - p_{\text{standAlone}}$  and standAlone  $\chi^2$ : no significant improvement (blue is data)
- ▶ We're continuing these studies, to align *individual* CSCs with tracks (difficult because of the angular distribution of cosmic rays)

- ▶ DT/CSC STARTUP misalignment scenario currently in the database describes the February CRAFT alignment (V5–12)
- ▶ Since then...
  - ▶ more chambers have been aligned, with more degrees of freedom (within wheels  $-1, 0, +1$ )
  - ▶ resolution has improved due to updated algorithms
  - ▶ knowledge about resolution has improved: split cosmics techniques,  $p_{\text{tracker}}/p_{\text{globalMuon}}$ , relative position checks, Monte Carlo study
- ▶ We've prepared a new geometry describing the state after CRAFT
  - ▶ random-generator sigmas are explicitly derived from the cross-checks, alignment corrections, and MC study
  - ▶ unaligned chambers (wheels  $\pm 2$  and sectors 1 and 7) still have large misalignments
- ▶ Appropriate for cosmic ray MC but not for physics: for physics analyses, we will align with collisions data (and therefore reach all chambers)

- ▶ DTAlignmentRcd for CRAFT (2\_2\_X format)  
`/castor/cern.ch/user/p/pivarski/DTCRAFTiter03_withCenteredTracker.db`
- ▶ CSCAlignmentRcd for CRAFT (2\_2\_X format)  
`/castor/cern.ch/user/p/pivarski/CSCCRAFT_HardwareAndPGAndDisk2.db`
- ▶ Updated STARTUP Scenario for Monte Carlo  
`/castor/cern.ch/user/p/pivarski/MCScenario_CRAFT1_22X_V02-09-04.db`  
`/castor/cern.ch/user/p/pivarski/MCScenario_CRAFT1_31X_V02-09-04.db`

- ▶ Alignment determined positions of each chamber individually from the tracker
- ▶ Cross-check with relative chamber positions
- ▶ Measured from difference of residuals with respect to an unbiased track:

$$(\text{track} - \text{station 3 hit}) - (\text{track} - \text{station 2 hit})$$

- ▶ New  $x$  resolution: 400  $\mu\text{m}$ , with the exception of station 4, sector 4 chambers (which have internal structure, under investigation)
- ▶ New  $\phi_y$  resolution: 0.3–0.5 mrad
